

## DEFINITIVE AMERICAN RELATIVE SUNSPOT NUMBERS FOR 1989

PETER O. TAYLOR  
 P.O. Box 5685  
 Athens, GA 30604

Received 29 January 1990

### Abstract

Final values of American Relative Sunspot Numbers for 1989 are provided. The values are based on observations made by members of the international network of American Sunspot Program collaborators and the AAVSO Solar Division.

\* \* \* \* \*

The daily mean values of American Sunspot Numbers for 1989 listed in Table I were computed according to the statistical methods which were described in Taylor (1985).

The final monthly mean values included in Table IIa continue the series of values which were presented in Taylor (1987a, 1988).

The final smoothed monthly mean values included in Table IIb continue the series which were presented in Taylor (1987b, 1988). The values were computed according to equation (1) from Waldmeier (1961):

$$R_{sm} = \frac{1}{24} [N_{i-6} + N_{i+6} + 2 (\sum_{-5}^{+5} N_i)], \quad (1)$$

where  $N$  is set equal to the final mean of the month under analysis, and other means are taken accordingly. Consequently,  $R_{sm}$  always lags six months behind the more recent final mean.

Figure 1 depicts this sunspot activity during 1989.
