Abstract

Photographic observations from 1964 to 1977 suggest that this is a semiregular variable with a period of about 120 days and a total range of  $9^m.9$  to  $11^m.0$  pv. A long-period variation is also suggested.

\* \* \* \* \*

This variable star was discovered by M. Huruata (1978), who gave the following data:

$$\alpha = 8^h 57^m 56^s, \quad \delta = +8^\circ 35' 19'' \quad (1900)$$

Type: SRb

Period: 45 days

The author has examined this star on the sky patrol plates of the Sonneberg Observatory, making 220 estimates of  $m_{pg}$  and 55 estimates of  $m_{pv}$ . The visual sequence provided by Huruata was used on both types of plates, with the constant correction  $m_{pg} = m_{pv} + 0^m.7$ . Figure 1 is a finding chart, and Figure 2, is the photographic light curve. Adopted times of maximum (M) and minimum (m) are indicated with arrows. A mean period of 120 days was obtained from the times of maxima and minima listed in Table 1.

TABLE I  
MAXIMA AND MINIMA OF H 4 CANCRI

| <u>Julian Day</u> | <u>Type</u> | <u><math>m_{pv}</math></u> | <u>Julian Day</u> | <u>Type</u> | <u><math>m_{pv}</math></u> |
|-------------------|-------------|----------------------------|-------------------|-------------|----------------------------|
| 2,438,390         | min.        | 10.8                       | 2,442,120         | min.        | 10.4                       |
| 2,438,460         | max.        | 10.0                       | 2,442,360         | min.        | 10.9                       |
| 2,438,500         | min.        | 10.8                       | 2,442,430         | max.        | 10.3                       |
| 2,438,780         | min.        | 10.6                       | 2,442,490         | min.        | 10.7                       |
| 2,438,820         | max.        | 10.0                       | 2,442,560         | max.        | 10.0                       |
| 2,438,880         | min.        | 10.7                       | 2,442,740         | min.        | 10.7                       |
| 2,438,940         | max.        | 10.0                       | 2,442,800         | max.        | 9.9                        |
| 2,439,070         | min.        | 10.3                       | 2,442,880         | min.        | 10.5                       |
| 2,439,120         | max.        | -                          | 2,443,050         | max.        | 10.1                       |
| 2,439,180         | min.        | 10.6                       | 2,443,110         | min.        | 10.7                       |
| 2,439,230         | max.        | 9.9                        | 2,443,160         | max.        | 10.4                       |
| 2,439,530         | min.        | 10.4                       | 2,443,220         | min.        | 10.6                       |
| 2,439,580         | max.        | 10.0                       | 2,443,300         | max.        | 10.0                       |

The activity of this star appears to vary and it may be summarized as follows:

| <u>Julian Day</u>   | <u>Nature of Variation</u>   |
|---------------------|--|
| 2,438,400-2,439,500 | Relatively regular variations with an amplitude of $0^m.6$ and a period of 120 days. |
| 2,439,500-2,440,500 | Irregular variation with a decreased amplitude of $0^m.2$ to $0^m.3$ .               |
| 2,440,500-2,441,200 | Not sufficient observational material.   |
| 2,441,200-2,441,800 | Irregular, slow variation.   |
| 2,441,800-2,443,300 | Variation with a mean period of 120 days.  |

There is a suspicion that the mean brightness varies with an amplitude of  $0^m.3$ , and, although the interval covered is too small to determine the period, it may be 4000 days.

The color index suggests that the star is of spectral type late-G or K, and these data confirm that it is of the type SRb with a range from  $9^m.9$  to  $11^m.0$ .

The author wishes to thank M. Huruhata and the Director of the Sonneberg Observatory, W. Wenzel, for their help.

Figure 1. Finding chart for H 4 Cancri with visual magnitudes supplied by M. Huruhata shown.

Figure 2. Photographic light curve of H 4 Cancri obtained from sky patrol plates of the Sonneberg Observatory. Times of maximum (M) and minimum (m) are indicated. Visual estimates by Huruhata (x) and photovisual estimates by the author (o) are shown.
